SOFTWARE ZETLAB

Software localization: translation of the software into any required locale's language

ZETLAB Company keeps pace with the times and provides measuring products together with corresponding software for automated processing of measured data in the sphere of vibroacoustic analysis, strain gauge measurements and seismology.

Task-specific software provides the user with all necessary means for data analysis in particular sphere as well as with various instruments for source signals and measurements results recording.

ZETLAB software is a virtual laboratory providing the user with powerful instruments for visual representation, spectral analysis, electrical parameters measurements, generation, recording and representation of signals.

ZETLAB software is not limited by any linguistic barriers, since the software localization is conducted in accordance with a simple scenario and in Excel format (components of ZETDictionary file are simply translated into the target language).

Thus, it is possible to complete software localization and adapt it to the required target language on the very next day upon receipt of the request.
